Introduction

SolidFire Storage Replication Adapter (SRA) defines the interface between VMware Site Recovery Manager (SRM) and the SolidFire replicated storage arrays. SolidFire SRA provides an interface for SRM to communicate with the storage arrays and execute supported workflows. Administrators can easily manage and configure replication of virtual machines hosted on the SolidFire storage clusters through SRM using the SolidFire SRA.

The combination of SRM and the SolidFire SRA provides a user-friendly interface to facilitate migration of storage arrays for planned and disaster recovery between the protected and recovery sites.

Installation and Configuration Notes

For complete installation instructions, refer to the *SolidFire_SRA_v1.0-Installation and Configuration* guide that is shipped along with the installer.

Minimum System Requirements

SRM should be installed and configured.

Support Matrix

The [VMware Compatibility Guide](#) includes information about supported hardware and software, including available SolidFire node types, supported protocols, Element OS, and SRM version.

What's in this Release

SolidFire has created the following features for the Storage Replication Adapter:

- MSI Installer/uninstaller bundle
- Discovery of SRA adapter by SRM
- Discovery of Storage Arrays by SRM
- Discovery of Replicated Volumes with iSCSI identification
- SRM Test Workflow
- SRM Recovery Workflow
- SRM Reprotect Workflow
- SRM Restore Workflow – This workflow is not available with SRM 5.5 GUI.

Known Issues and Workarounds

NA

Resolved Issues

NA
